MK Trenchsafety Systems
A height adjustable edge protection system for trenches

This product is the result of a request from one of our customers who asked us to design a system to give a standard compliant height of edge protection regardless of whether the mounting surface was a level/even surface, as is nearly always the case with trench sheets or trench piles.

The result can be seen in the pictures, the height adjustable nature of the uprights allow up to 1 metre height differential in the protruding trench piles and at the same time the upper rail and any gaps between will be fully compliant to BS EN 13374.

- No tools required for installation
- Lightweight and robust
- Reusable
- Height adjustable
- Easy storage and transportation
- High visibility powder coating
- Suitable for use with trench sheets, trench piles or can be easily reconfigured to attach to any vertical flange
- Fully compliant with BS EN 13374 – Temporary edge protection systems
